

The tag stayed. The binary changed.

OVHcloud CLI release substitution, 19 October 2026

Tags held. The assets were replaced.

OVHcloud: v0.11.0 to v0.15.0 affected, for builds downloaded in a window on 19 October 2026 (14:47 to 16:21, 16:21, UTC+2). Vendor figure: 1h33.

Source: OVHcloud advisory GHSA-862f-55f5-vmvw (vendor account)

A tag identifies source. An asset asset is a separate object.

The reporter's CI saw a changed SHA-256 and a later, dirty commit. The tag and Go module proxy still pointed to the original commit.

Source: issue #300 (reporter evidence); advisory (vendor account)

The checksum shared the binary's path.

Reporting indicates checksums.txt moved through the same release same release authority as the binaries. Compared together, both both can agree.

Source: secondary reporting; reporter's retained-digest check (issue #300)

Retention gives continuity. Validation gives identity.

RETAINED DIGEST

Detects a later change. Does not show the first download was authentic.

VALIDATED AT INGESTION

Checked against trusted evidence first. A mirror that validated preserves a bad file as faithfully as a good one.

Source: analysis; Rack2Cloud evidence-layer principle

A bad-hash list is not a good-good-hash list.

A match identifies a known-bad file. A non-match says nothing about authenticity.

	LISTED: MALICIOUS	KNOWN-GOOD
darwin arm64	md5 · listed	none published
darwin x86_64	md5 · listed	none published
linux arm64	md5 · listed	none published
linux x86_64	md5 · listed	none published
windows x86_64	md5 · listed	none published

Source: advisory appendix (vendor), read as stated

Pinning a tag pins a label.

Each install path trusts a different object. The control is a validated validated digest, not the version string.

RELEASE ASSET

trusts the uploaded file

SOURCE AT TAG

trusts the commit the tag points to

MODULE PROXY

trusts the proxy's record of that commit

No path or platform called unaffected: sources conflict.

Downloaded is not executed.

OVHcloud's guidance is conditional on running the CLI. The advisory's affected-builds wording speaks of downloads only.

DOWNLOADED IN THE WINDOW

Not proof of exposure by itself.

DOWNLOADED AND RUN

Advisory: treat the secrets on that computer as compromised. It describes an envchecker- folder in the temp directory as an indicator.

Source: OVHcloud advisory (vendor account)

Eight fields at acquisition.

Keep the record in a separate trust domain the publisher cannot
cannot rewrite.

tool and version	download source
acquisition timestamp (UTC)	binary digest
source of expected digest	independent validation at ingestion
execution status	accessible credential scope

A publisher-served digest cannot fill this row.

Source: Rack2Cloud acquisition worksheet

Know what you fetched, and what you checked it against.

If the answer lives only in the publisher's release page, you do not
do not have an answer.
